Anatomy And Physiology Cardiovascular System

Anatomy of the Heart The cardiovascular system can be compared to a muscular pump equipped with one-way valves and a system of large and small plumbing tubes within which the blood travels. Heart Structure and Functions The modest size and weight of the heart give few hints of its incredible strength.

Cardiovascular System Anatomy and Physiology: Study Guide ...

The cardiovascular system relates to the heart, blood vessels, and blood. Blood contains proteins in its red blood cells called as hemoglobin which carries oxygen to cells and tissues in the body. The cardiovascular system can be deemed as the transport system of the body.

Cardiovascular System - Anatomy And Physiology

The cardiovascular system is an organ system that permits blood to circulate and transport nutrients, oxygen, carbon dioxide, hormones, and blood cells to and from the cells in the body to provide nourishment and help in fighting diseases, stabilize temperature and pH, and maintain homeostasis. It is divided into two main parts:

Cardiovascular System - Anatomy & Physiology

One of the major roles of the cardiovascular system is to deliver oxygen taken in at the lungs and deliver it to the tissues. The interaction between the heart and the blood returning from the body is presented along with the connection between the heart and lungs. Tutorial Features:

Anatomy and Physiology - Cardiovascular System

The cardiovascular system is a closed system if the heart and blood vessels. The heart pumps blood through a closed system of blood vessels. Blood vessels allow blood to circulate to all parts of the body. Arteries usually colored red because oxygen rich, carry blood away from the heart to capillaries within the tissues.

The heart: Anatomy, physiology, and function

Components of the Cardiovascular System •consists of the heart plus all the blood vessels •transports blood to all parts of the body in two 'circulations': pulmonary (lungs) & systemic (the rest of the body) •responsible for the flow of blood, nutrients, oxygen and other gases, and hormones to and from cells

Cardiovascular System Components of the Cardiovascular System

The heart, blood vessels, and blood help to transport vital nutrients throughout the body as well as remove metabolic waste. They also help to protect the body and regulate body temperature. The cardiovascular system consists of the heart, blood vessels, and blood. This system has three main functions:

Functions of the Cardiovascular System

function of the cardiovascular system - delivers oxygen/nutrients to cells and tissues - removes carbon dioxide and waste products from cells and tissues a hollow cone organ which weighs less than a pound and is about the size of your fist:

Anatomy and Physiology: Cardiovascular System

The circulatory system includes both the cardiovascular system and the lymphatic system. The cardiovascular system moves blood throughout the body, and the lymphatic system moves lymph, which is a clear fluid that's similar to the plasma in blood. Blood contains nutrients from the foods you eat and oxygen from the air you breathe.
