### Quiz & Worksheet - Anatomy of the Heart | Study.com

THE EXTERNAL ANATOMY OF THE HEART, continued d. The artery that directs blood from the heart to the lungs carries deoxygenated blood (blood that has left its oxygen molecules in many cells so that it is now "oxygen-poor"). Name the artery that carries deoxygenated blood.

### Mrs. Hille's FunZone - Class Supply List

Heart consists of 4 chambers. At first heart is divided into right and left side by the septum. Each side is further divided into 2 chamber each by artioventricular valve. The upper two chambers are called atrium and lower two are called ventricles.

### Human Heart-Gross structure and Anatomy - Online Biology Notes

The human heart is similar to the hearts of other vertebrates. Mammals and birds (and some reptiles) have what is known as a double-loop circulatory system, where blood leaves the heart, goes to the lungs where it becomes oxygenated and then returns to the heart before delivering the oxygenated blood to the rest of the body.
