Among the usual dental materials, ceramics exhibit the lowest adhesive capability due to their inert surface. Based on various papers, zirconia dental ceramics, for instance, manifest lower adherence than metals, or even natural teeth. Some of the most common dental materials and the characteristics of the formed biofilm are presented in Table 7.2. It must be mentioned that based on the literature data, the experimental differences are notable and consequently their comparison is only ...

The early stages of dental materials as a science were characterized by answering how the natural and artificial material behaves. The development and discovery of new materials were based in fortuitous observations, i.e., the acid etch surface observed by Buonocore and then applied to dental enamel, or mixing materials in order to improve properties which were shown to be effective as seen in published manuscripts of Wilson and Kent since 1968 up to 1972 that culminate the development of ...
