Geometry from a Differentiable Viewpoint by John McCleary

Geometry from a Differentiable Viewpoint The development of geometry from Euclid to Euler to Lobachevskiĭ, Bolyai, Gauss, and Riemann is a story that is often broken into parts - axiomatic geometry, non-Euclidean geometry, and differential geometry. This poses a problem for undergraduates: Which part is geometry?

Geometry from a Differentiable Viewpoint

The text serves as both an introduction to the classical differential geometry of curves and surfaces and as a history of the non-Euclidean plane. The book begins with the theorems of non-Euclidean geometry, then introduces the methods of differential geometry and develops them towards the goal of constructing models of the hyperbolic plane.

The divide between undergraduate differential geometry and graduate geometry is too great. A beginning graduate student could walk into a course on differentiable manifolds and Riemannian Geometry with no undergraduate diff geometry and be fine (as I did), but it is tough road since much of the intuition and motivation is missing.

Definition. Let M and N be differentiable manifolds and $f: M \rightarrow N$ be a differentiable map between them. The map f is a submersion at a point $p \in M$ if its differential: $df_p: T_p M \rightarrow T_p N$ is a surjective linear map. In this case p

is called a regular point of the map f , otherwise, p is a critical point. A point ϵ is a regular value of f if all points p in the preimage $f^{-1}(\epsilon)$ are regular points.
