This volume provides an overview of recent advances in the ecology of various kinds of non-forested ecosystems (grasslands, deserts, and wetlands) on a variety of topics, including species diversity and the factors that control species diversity, impacts of disturbances (grazing, mowing, fire, flooding), establishment and reproduction ecology, and plant-plant interactions.

Different types of relationship between herbaceous species richness and several parameters indicating abundance of plant material (herbaceous, woody plants, litter and bare ground cover) are presented. The data were obtained from 50 sites along a 300 km strip running from E to W within Spain and Portugal. Each site was representative of the silvo-pastoral landscape of the Mediterranean type ...

Trientalis latifolia (Broadleaf Starflower) is a perennial herbaceous plant of the ground layer of forests in western North America. Herbaceous plants in botany, frequently shortened to herbs, are vascular plants that have no persistent woody stems above ground. Herb has other meanings in cooking, medicine, and other fields.

Further, results showed that addition of 60kg N; increased 20% and 63% herbaceous plant biomass and richness, respectively over the control plots, and addition of 120kg N; increased 10% biomass but drastically lowered the species richness by 35% over the 60kg N treated plots . Thus, initially species diversity increased (from control to 60kg N ...

Herbaceous plants are plants that, by definition, have non-woody stems. Their above-ground growth largely or totally dies back in winter in the temperate zone, but they may have underground plant parts (roots, bulbs, etc.) that survive. Technically, all annual plants are herbaceous, because an annual is a non-woody plant.

Alexander von Humboldt's work connecting plant distributions with environmental factors played an important role in the genesis of the discipline of plant ecology. Plant ecology has its origin in the application of plant physiology to the questions raised by plant geographers.

1 Using data from a survey of over 10 000 1-m² quadrats in a 3000-km² area, we examined the relationship between abundance and range for the vascular plant flora of central England. 2 At the level of the whole landscape, abundance was not related to local, regional or national range. Local, regional and national range were closely related to each other.

Phenotypic plasticity is considered to play a major role in determining the success of many invasive plants (Nicotra et al. 2010; Pyšek and Richardson 2007; Richards et al. 2006), by affecting both the short-term response of plant populations to environmental variation and their long-term persistence (Matesanz et al. 2012).
