While u , v , p and q are the solutions to the Navier-Stokes equations, we denote the numerical approximations by capital letters. Assume we have the velocity field U_n and V_n at the n th time step (time t), and condition (3) is satisfied. We find the solution at the $(n+1)$ st time step (time $t+\Delta t$) by the following three step approach: 1.

Solution We are to discuss the difference between uniform and nonuniform flow. Analysis The flow in a channel is said to be uniform if the flow depth (and thus the average velocity) remains constant. Otherwise, the flow is said to be nonuniform or varied, indicating that the flow depth varies with distance in the flow direction.

Incompressible Flow Solutions Incompressible flows are by far the most common type of flows encountered in engineering problems. They are different than compressible flows mainly due to the missing equation of state. Density is not an unknown and pressure does not have any thermodynamic meaning. In an incompressible flow the role of pressure is ...
